

LARGE SYNOPTIC SURVEY TELESCOPE

Large Synoptic Survey Telescope (LSST) Data Management Organization and Management

William O'Mullane, Mario Juric, Jeffrey P Kantor, Tim Axelrod,
Roberta Allsman

LDM-294

Latest Revision: 2017-06-13

Draft Revision NOT YET Approved - This LSST document has been approved as a Content-Controlled Document by the LSST DM Technical Control Team. If this document is changed or superseded, the new document will retain the Handle designation shown above. The control is on the most recent digital document with this Handle in the LSST digital archive and not printed versions. Additional information may be found in the corresponding DM RFC. - **Draft Revision NOT YET Approved**

Abstract

This is the DM plan updated from the v2 of 2014. It covers the organisation and management of DM for LSST.

Data Management Organization and Management

1 Introduction

1.1 Purpose

This document defines the mission, goals and objectives, organization and responsibilities of the LSST Data Management (DM). The document is currently scoped to define these elements for the LSST Design and Development, Construction, and Commissioning phases. It does not address any ongoing mission for the DM during LSST operations.

1.2 Mission statement

Stand up operable, maintainable, quality services to deliver high-quality LSST data products for science and education, all on time and within reasonable cost.

1.3 Goals And Objectives

LSST Data Management will:

- Define the data products, data access mechanisms, and data management and curation requirements for the LSST
- Assess current and LSST-time frame technologies for use in providing engineered solutions to the requirements
- Define a secure computing, communications, and storage infrastructure and services architecture underlying LSST data management
- Select, implement, construct, test, document, and deploy the LSST data management infrastructure, middleware, applications, and external interfaces
- Adopt appropriate cybersecurity measures throughout data management and especially on external facing services.
- Document the operational procedures associated with using and maintaining the LSST data management capabilities

- Evaluate, select, recruit, hire/contract and direct permanent staff, contract, and in-kind resources in LSST and from partner organizations participating in LSST Data Management initiatives.

The DM goals in selecting and, where necessary, developing LSST software solutions are:

- Acquire and/or develop solutions: To achieve its mission, LSST DM subsystem prefers to acquire and configure existing, off-the-shelf, solutions. Where no satisfactory off-the-shelf solutions are available, DM develops the software and hardware systems necessary to:
 - Enable the generation of LSST data products at the LSST Archive and Satellite processing center, and
 - Enable the the serving of LSST data products from the two LSST DACs (one in the U.S., and one in Chile).
- Maintain coherent architecture: DM software architecture is actively managed at the subsystem level. A well engineered, and cleanly designed codebase is less buggy, more maintainable, and makes developers who work on it more productive. Where there is no significant impact on capabilities, budget, or schedule, LSST DM prefers to acquire and/or develop reusable, open source, solutions.
- Support reproducibility and insight into algorithms: Other than when prohibited by licensing, security, or other similar considerations, DM makes all newly developed source code public, especially the Science Pipelines code. Our primary goal in publicizing the code is to simplify reproducibility of LSST data products, and provide insight into algorithms used. The software is to be documented to achieve those goals.
- Opportunities beyond LSST: LSST DM codes may be of interest and (re)used beyond the LSST project (e.g., by other survey projects, or individual LSST end-users). While enabling or supporting such applications goes beyond LSST's construction requirements, cost and schedule-neutral technical and programmatic options that do not preclude them and allow for future generalization should be strongly preferred.

Background decision material on choices made in DM will be documented in technical notes (DMTN) which will be lodged in DocuShare (see Section 3.2).

2 Data Management Conceptual Architecture

The DM Subsystem Architecture is detailed in LDM-148. A few of the higher level diagrams are reproduced here to orientate the reader within DM.

During Operations, components of the DM Subsystem will be installed and run in multiple locations. These include:

- The Commissioning Cluster, which may be physically at NCSA in Urbana-Champaign
- The main center in NCSA enclave in Urbana-Champaign
- The US Data Access Center (DAC), also at NCSA in Urbana-Champaign
- The Chilean DAC in the Base Facility in La Serena Chile
- The Satellite Processing Center at CC-IN2P3 in Lyon, France

Figure 1 shows the various DM components which will be used in operations and the physical compute environments in which they will be deployed. Bulk data storage and transport between components is provided by the Data Backbone. This complex piece of infrastructure is displayed in Figure 3.

Science users will access the data products produced by LSST through the Science Platform, as shown in Figure 2.

Figure 4 shows the common infrastructure and services layer which underlies the compute environments. This does not list specific technologies for management/monitoring, provisioning/deployment, or workload/workflow — these are still under development — but consider industry-standard tools such as Nagios, Puppet/vSphere/OpenStack/Kubernetes, and Pegasus.

2.1 External Interfaces

The DM external interfaces are controlled by the ICDs listed in Table ??.

FIGURE 1: DM components as deployed during Operations. Where components are deployed in multiple locations, the connections between them are labeled with the relevant communication protocols. Science payloads are shown in blue.

FIGURE 2: The sub-components of the Science Platform.

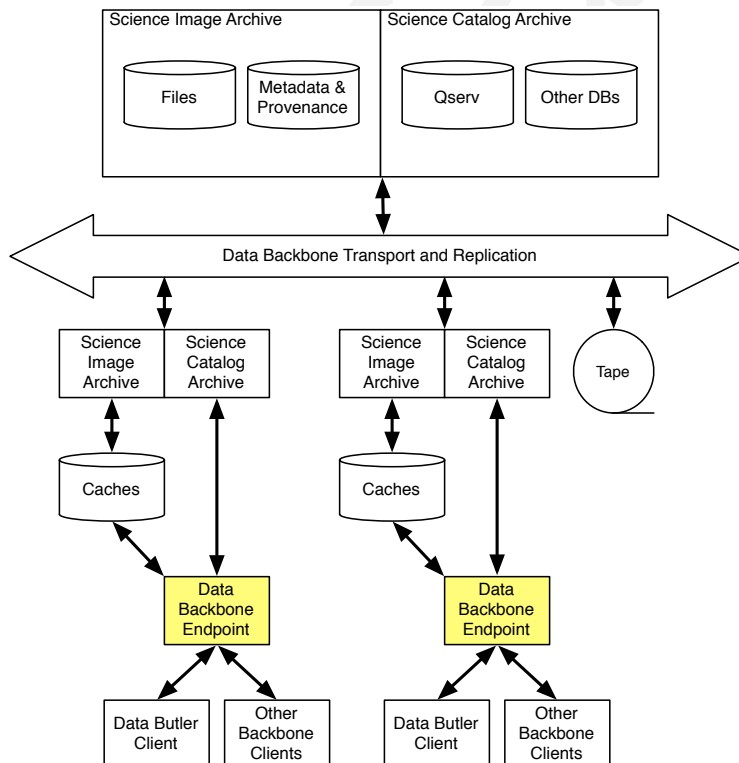

FIGURE 3: The Data Backbone links all the physical components of DM.

FIGURE 4: Common infrastructure services available at each DM location.

TABLE 2: DM Interface Control Documents

LSE-130	List of Data Items to be Exchanged Between the Camera and Data Management
LSE-131	Data Management Interface Requirements to Support Education and Public Outreach
LSE-140	Auxiliary Instrumentation Interface between Data Management and Telescope

2.1.1 Auxiliary data in DM

Certain tasks in DM rely on external catalogs and other information. Currently we believe we need:

1. Gaia catalogue (Release 2) as a photometry baseline.

3 Data Management Organization Structure

This section defines the organization structure for the period in which the DM System is developed and commissioned, up to the start of LSST Observatory operations.

The DM Project Manager (William O'Mullane), Deputy Project Manager (John Swinbank) and DM Project Scientist (Mario Jurić), who are known collectively as DM Management, lead the DM Subsystem. The Project Manager has direct responsibility for coordination with the overall LSST Project Office, the LSST Change Control Board, the LSST Corporation, and LSST partner organizations on all budgetary, schedule, and resource matters. The Project Scientist has primary scientific and technical responsibility in the DM and responsibility for ensuring that the scientific requirements of the LSST are supported, and is a member on the LSST Project

Science Team (PST).

As shown in Figure 5, the organization now features major products each with a product owner relating to a major element of the DM Subsystem (Level 2 Work Breakdown Structure elements).

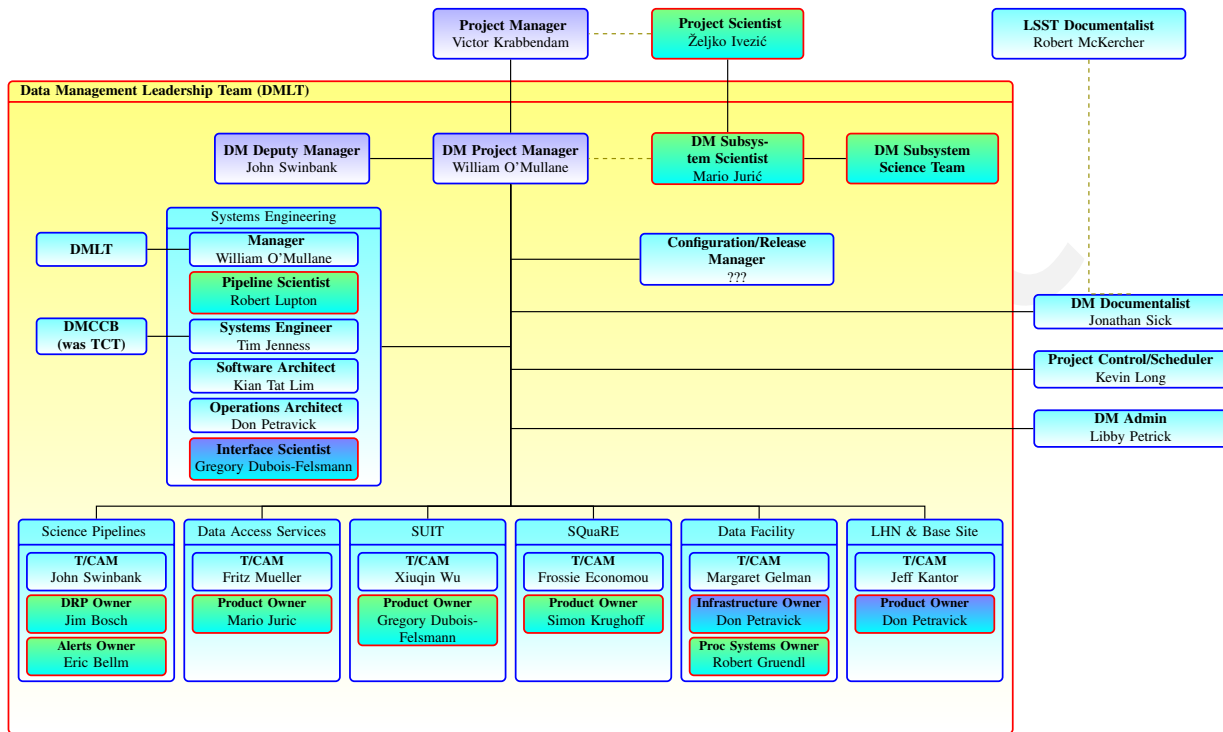

FIGURE 5: DM organization with Scientists in Green.

3.1 Meetings

As a diverse and distributed organization DM staff will participate in a considerable number of meetings. NSF and Aura have many rules on meeting attendance and LSST keep policies updated accordingly on the project travel web page <https://project.lsst.org/travel/policies-procedures>. This include the travel summary report template <https://project.lsst.org/sites/default/files/Travel/Travel%20Summary%20Report.pdf> every traveler must fill after attending a meeting. More details are in Document-13760.

A detailed debrief note or presentation may be asked of travelers to specific meetings of interest by the DMLT.

3.2 Document Management

DM documents will follow the System Engineering Guidelines of LSST. PDF versions of released documents shall be put in DocuShare in accordance with the Project’s Document Management Plan [LPM-51]. LPM level documents are released on agreement of the DMCCB (Section 7.4), uncontrolled documents such as technotes may be released when the author decides it is appropriate or they are asked to release it by the Project Manager.

The Document Tree for DM is shown in Figure 6, it is not exhaustive but gives a high level orientation for the main documents in DM and how they relate to each other. Some documents shown in red are not yet written.

FIGURE 6: Outline of the documentation tree for DM software relating the high level documents to each other.

Figure 6 has one box for End User documentation, this is a major set of documentation for DM which will be web based as described in LDM-493. Figure 7 shows the intended web hierarchy for the end user documentation.

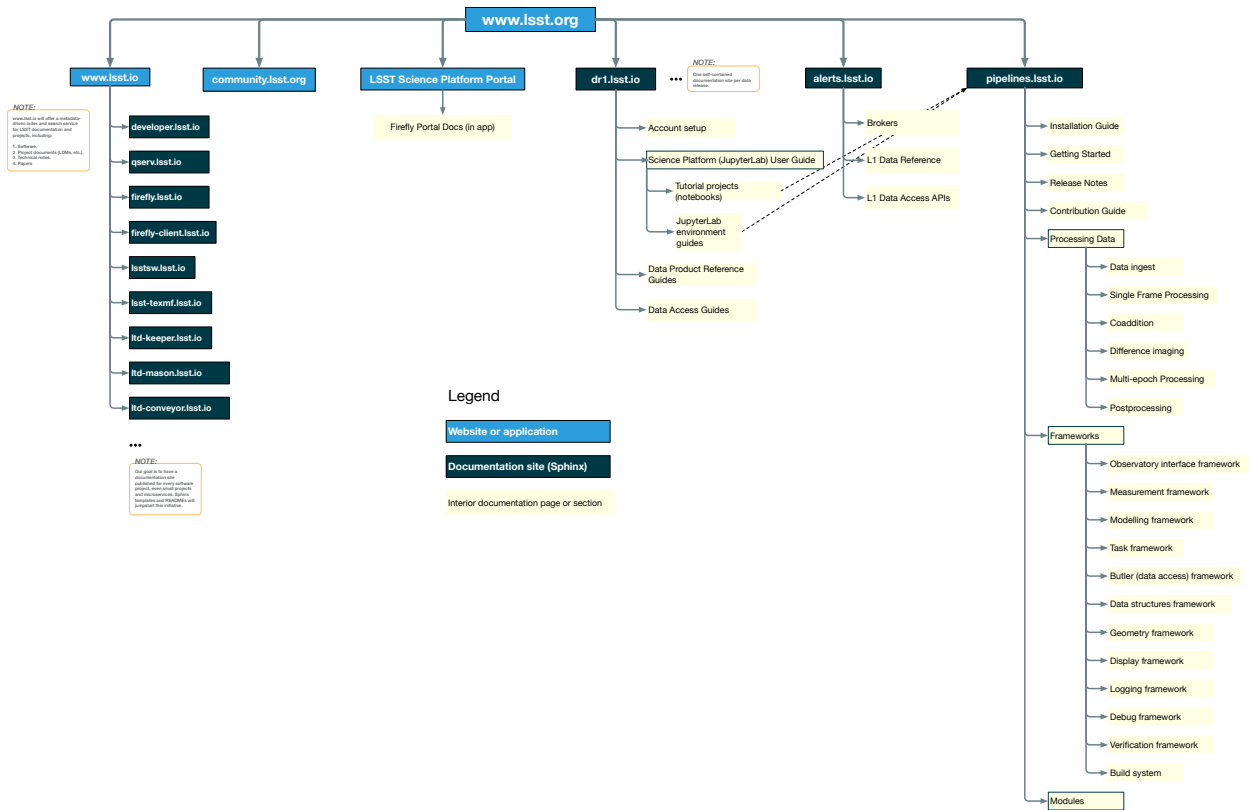

FIGURE 7: Outline of the web hierarchy for the DM end user documentation.

Service-level documentation follows the layered service architecture of the LSST Data Facility (see Figure 8).

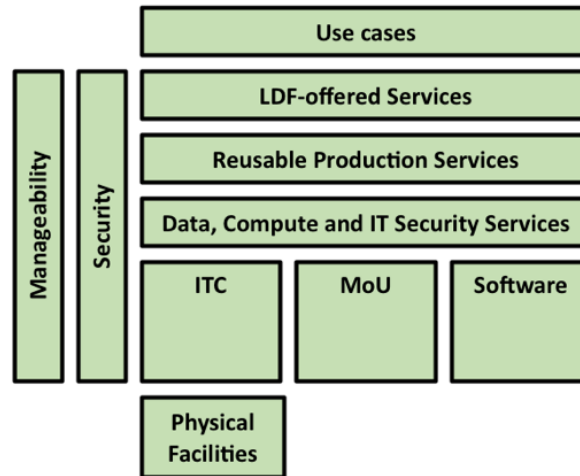

FIGURE 8: Outline of layered service architecture of the Data Facility.

3.2.1 Documentation of Cross-Cutting Aspects for services

The cross-cutting aspects of the LSST Data Facility, Security and Operational Manageability, are represented by the vertical boxes. Documentation of these aspects describes policies, procedures, and supporting management frameworks, including:

1. LDF service management framework: service catalog, service-level agreements (SLAs), configuration management database (CMDB), service monitoring.
2. LDF service management processes and context in the overall project: incident response, request response, issue tracking, problem management and the problem management database, change management and change control authority, release management.
3. Overview of the security enclave structure
4. Security controls and incident response procedures
5. Disaster recovery and continuity policies

3.2.2 Documentation of Service Layers

The box at the top of the figure, Use Cases, represents subsystem-level and project-level operational use cases. The next layer, LDF-offered Services, represents specific services offered by the Data Facility which satisfy those use cases. Documentation of this layer includes:

1. For each service, a Concept of Operations (ConOps) which summarizes how a service operates to satisfy a use case. The ConOps describes the operational characteristics of the production system, context within overall LSST operations, and representative scenarios.
2. For each service, a Theory of Operations, which provides a mental model of a constructed system. The Theory of Operations explains how the constructed service both fulfills the ConOps and integrates with the cross-cutting aspects of the facility. The document describes the overall architecture of the service and dependency on supporting service layers; integration into aspects of computer security, information security and business continuity; and integration into incident reporting and response, availability and capacity management, and change management.

The next two layers, Reusable Production Services and Data, Compute, and IT Security Services, represent tiers of supporting service. Documentation of these layers includes a Theory of Operations, as described above, explaining the dependencies on supporting service and ITC layers, and integration with cross-cutting aspects of the facility.

The ITC box represents hardware components supporting all LDF services. Documentation of ITC describes the system elements at all facility sites, administration within each security enclave and integration with security operations, the overall provisioning plan, ITC system monitoring and integration into the service monitoring framework, and integration into service management processes including configuration management and change management.

The Software box represents service software components being developed by the LSST Data Facility. Documentation of software elements follows the standards of the LSST software stack.

Documents are managed as configuration items in the LSST Data Facility CMDB.

3.2.3 Draft Documents

Draft DM documents will be kept in GitHub. A single repository per document will be maintained with the head revision containing the *released* version which should match the version on docushare. Each repository will be included as a *submodule* of a single git repository located at <https://github.com/lstt-dm/dm-docs>.

Use of Google Docs or confluence is tolerated but final delivered documents must conform to the standard LSST format, and hence either produced with LaTeX, using the `lsst-texmf` package¹, or Word, using the appropriate LSST template [Document-9224, Document-11920]. The precursor document should then be erased with a pointer to the baseline document, stored in GitHub.

End user documentation will most likely and appropriately be web based and the scheme for that is described in LDM-493.

3.3 Configuration Control

Configuration control of documents is dealt with in Section 3.2. Here we consider more the operational systems and software configuration control.

3.3.1 Software Configuration Control

We should have a configuration management plan covering this.

DM follows a git based versioning system based on public git repositories and the approach is covered in the developer guide <https://developer.lsst.io/>. The master branch is the stable code with development done in *ticket* branches (named with the id of the corresponding Jira Ticket describing the work. Once reviewed a branch is merged to master.²

As we approach commissioning and operations DM will have a much stricter configuration control. At this point there will be a version of the software which may need urgent patching,

¹<https://lsst-texmf.lsst.io>

²LSE-14 seem out of date and should be updated or revoked - titled a guideline it seems inappropriate as an LSE.

a next candidate release version of the software, and the master. A patch to the operational version will require the same fix to be made in the two other versions. The role of the DM Change Control Board (DMCCB; Section 7.4) becomes very important at this point to ensure only essential fixes make it to the live system as patches and that required features are included in planned releases.

We cannot escape the fact that we will have multiple code branches to maintain in operations which will lead to an increase in work load. Hence one should consider that perhaps more manpower may be needed in commissioning to cope with urgent software fixes while continuing development. The other consideration would be that features to be developed post commissioning will probably be delayed more than one may think, as maintenance will take priority.³

3.3.2 Hardware Configuration Control

On the hardware side we have multiple configurable items, we need to control which versions of software are on which machines. These days tooling like Puppet make this reasonably painless. Still the configuration must be carefully controlled to ensure reproducible deployments providing correct and reproducible results. The exact set of released software and other tools on each system should be held in a configuration item list. Changes to the configuration should be endorsed by the DMCCB.

The sizing model for compute hardware purchasing is detailed in LDM-144 LDM-141 and LDM-138.

3.4 Risk Management

Risks will be dealt with within the LSST Project framework as defined in LPM-20. Risks in DM may be sent to the DM project manger or Deputy project manager at any time for consideration to be included in the formal risk register (appropriate costed and weighted). All risks are reviewed regularly by the DM Project manager and System engineer (minimum each 3 months).

³WOM identifies this as the maintenance surge.

3.5 Quality Assurance

In accordance with the project QA plan LPM-55 we will perform QA on the software products. This work will mainly be carried out by SQuaRE (Section 8.1.1). Quality assurance here means compliance with project guidelines for production, in our case of software production. A part of this is to have a verification/validation plan(s) which in and of itself is a major task (see Section 3.7).

3.6 Action item control

Actions in DM are tracked as Jira issues and periodically reviewed at DMLT meetings.

3.7 Verification and Validation

We intend to verify and validate as much of DM as we can before commissioning and operations. This will be achieved through testing and operations rehearsals/data challenges. The verification and validation approach is detailed in LDM-503 including a high level test schedule.

4 Project Controls

DM follows the LSST project controls system, as described in LPM-98. Specific DM processes for project planning are elaborated in LDM-472.

The LSST Project Controller is responsible for the PMCS and, in particular, for ensuring that DM properly complies with our earned value management requirements. He is the first point of contact for all questions about the PMCS system.

4.1 Schedule

The entire LSST project schedule is held in Primavera. Tied to major project milestones we have a series of DM tests which need to be performed to show readiness for the different project phases. This is depicted in Figure 9.

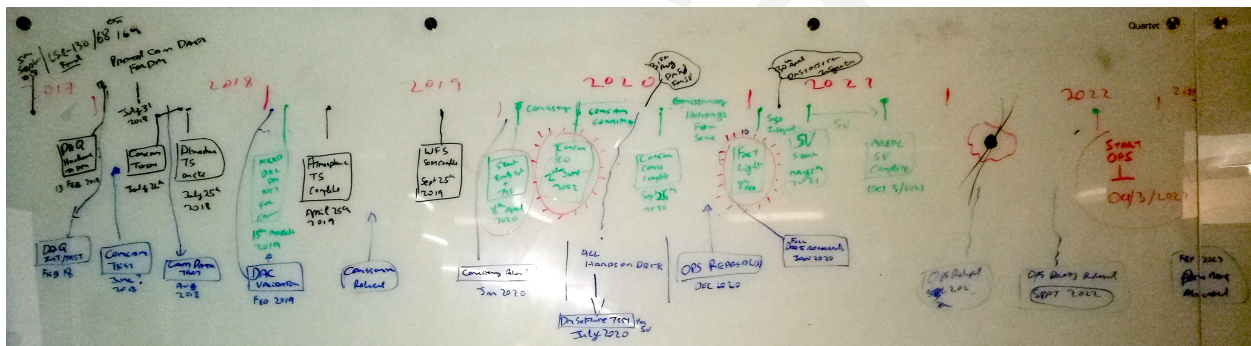

FIGURE 9: DM major milestones(blue) in the LSST schedule.

4.2 Work Breakdown Structure

The DM WBS is laid out in LPM-43 with definitions provided in LPM-44.

The WBS provides a hierarchical index of all hardware, software, services, and other deliverables which are required to complete the LSST Project. It consists of alphanumeric strings separated by periods. The first component is always “1”, referring the LSST Construction Project. “02C” in the second component corresponds to Data Management Construction. Subdivisions thereof are indicated by further digits. These subdivisions correspond to teams within the DM project. The top level WBS elements are mapped to the lead institutes in Ta-

TABLE 3: DM top level Work Breakdown Structure

WBS	Description	Lead Institution
1.02C.01	System Management	LSST Tucson
1.02C.02	Systems Engineering	LSST Tucson
1.02C.03	Alert Production	University of Washington
1.02C.04	Data Release Production	Princeton University
1.02C.05	Science User Interface	Caltech IPAC
1.02C.06	Science Data Archive	SLAC
1.02C.07	Processing Control & Site Infrastructure	NCSA
1.02C.08	International Communications. & Base Site	LSST Tucson
1.02C.09	Systems Integration & Test	NCSA & LSST Tucson
1.02C.10	Science Quality & Reliability Engineering	LSST Tucson

Table 3, the lead institutions roles are outlined in Section 8. The various groups involved in the WBS are briefly described in Section 7.

5 Products

The products of DM are not the data products defined in LSE-163, rather they are the artefacts, systems and Services, we need to produce those products. Figure 10 is an initial attempt to define the product tree for DM. Appendix ?? provides a trace of products to requirements.

6 Roles in Data Management

This section describes the responsibilities associated with the roles shown in Figure 5.

6.1 DM Project Manager (DMPM)

The DM Project Manager is responsible for the efficient coordination of all LSST activities and responsibilities assigned to the Data Management Subsystem. The DM Project Manager has the responsibility of establishing the organization, resources, and work assignments to provide DM solutions. The DM Project Manager serves as the DM representative in the LSST Project Office and in that role is responsible for presenting DM initiative status and submitting new DM initiatives to be considered for approval. Ultimately, the DM Project Manager,

FIGURE 10: DM product tree. - there are over 200 products, this tree is to convey an idea of the products even if not legible. The full list is given in Appendix A

in conjunction with his / her peer Project Managers (Telescope, Camera), is responsible for delivering an integrated LSST system. The DM Project Manager reports to the LSST Project Manager. Specific responsibilities include:

- Manage the overall DM System
- Define scope and request funding for DM System
- Develop and implement the DM project management and control process, including earned value management
- Approve the DM Work Breakdown Structure (WBS), budgets and resource estimates
- Approve or execute as appropriate all DM outsourcing contracts
- Convene and/or participate in all DM reviews
- Co-chair the DM Leadership Team (Section 7.3)

6.2 DM Deputy Project Manager (DDMPM)

The PM and deputy will work together on the general management of DM and any specific PM tasks may be delegated to the deputy as needed and agreed. In the absence of the PM the deputy carries full authority and decision making powers of the PM. The DM Project Manager will keep the Deputy Project Manager informed of all DM situations such that the deputy may effectively act in place of the Project Manager when absent.

6.3 DM Subsystem Scientist (DMSS)

The DM Subsystem Scientist (DMSS) has the ultimate responsibility for ensuring DM initiatives provide solutions that meet the overall LSST science goals. As such, they lead the definition and understanding of the science goals and deliverables of the LSST Data Management System, and are accountable for communicating these to the DM engineering team.

The DM Subsystem Scientist reports to the LSST Project Scientist. The DMSS are a member of the LSST Change Control Board and the Project Science Team. They chair and direct the work of the DM System Science Team (Section 7.1).

Specific responsibilities and authorities include (**cite the project-level R2A2 document, once issued**):

- Communicates with DM science stakeholders (LSST Project Scientist and Team, advisory bodies, the science community) to understand their needs and identifies aspects to be satisfied by the DM Subsystem.
- Develops, maintains, and articulates the vision of DM products and services responsive to stakeholder needs.
- Works with the LSST Project Scientist to communicate the DM System vision to DM stakeholders. Works with the DM Project Manager to communicate and articulate the DM System vision and requirements to the DM construction team.
- Regularly monitors DM construction team progress and provides feedback to the DM Project Manager to ensure the continual understanding of and adherence to the DM vision, requirements, and priorities.
- Develops and/or evaluates proposed changes to DM deliverables driven by schedule, budget, or other constraints.
- Provides advice to the DM Project Manager on science-driven prioritization of construction activities.
- Validates the science quality of DM deliverables and the capability of all elements of the DM System to achieve LSST science goals.
- Serves as Data Management Liaison as requested by LSST Science Collaborations
- Provides safe, effective, efficient operations in a respectful work environment.

Specific authorities include (**cite the project-level R2A2 document, once issued**):

- Defines the vision and high-level requirements of the DM products and services required to deliver on LSST science goals.
- Defines the science acceptance criteria for DM deliverables (both final and intermediate) and validates that they have been met (Science Validation).

- Hires or appoints DM System Science Team staff and other direct reports and defines their responsibilities.
- Advises and consents to the appointments of institutional DM Science Leads.
- Delegates authority and responsibility as appropriate to institutional Science Leads and other members of the DM System Science Team.
- Represents and speaks for the LSST Data Management.
- Convenes and/or participates in all DM reviews.
- Co-Chairs the DM Leadership Team

6.4 Project Controller/Scheduler

The DM Project Controller is responsible for integrating DM's agile planning process with the LSST Project Management and Control System (PMCS). Specific responsibilities include:

- Assist T/CAMs in developing the DM plan
- Synchronize the DM plan, managed as per LDM-472, with the LSST PMCS
- Ensure that the plan is kept up-to-date and milestones are properly tracked
- Create reports, Gantt charts and figures as requested by the DMPM

6.5 Product Owner

A product owner is responsible for the quality and acceptance of a particular product. The product owner should sign off on the requirements to be fulfilled in every delivery and therefore also on any descopes or enhancements. The product owner should define tests which can be run to prove a delivery meets the requirements due for that product.

6.6 Pipeline Scientist

Several DM products come together to form the LSST pipeline. The Pipeline Scientist is the product owner for the overall pipeline.

The Pipeline Scientist should:

- Provide guidance and test criteria for the full pipeline including how QA is done on the products
- Keep the big picture of where the codes are going in view. Predominantly the algorithms, but also the implementation and architecture (as part of the System Engineering Team Section 7.2).
- Advise on how we should attack algorithmic problems, providing continuing advice to subsystem product owners as we try new things.
- Advise on calibration issues, provide understanding of the detectors from a DM point of view
- Advise on the overall (scientific) performance of the system, and how we'll test it. Thinking about all the small things that we have to get right to make the overall system good.

6.7 Systems Engineer

With the System Engineering Team (Section 7.2) the Systems Engineer owns the DM entries in the risk register and is generally in charge of the *process* of building DM products.

As such, the Systems Engineer is responsible for managing requirements as they pertain to DM. This includes:

- Update and ensure traceability of the high level design & requirements documents: DMSR (LSE-61), OSS (LSE-30), and LSR (LSE-29)
- Oversee work on lower level requirements documents
- Ensure that the system is appropriately modeled in terms of e.g. drawings, design documentation, etc
- Ensure that solid verification plans and standards are established within DM

In addition, the Systems Engineer is responsible for the process to define & maintain DM interfaces (internal and external)

- Define and enforce standards for internal interfaces
- Direct the Interface Scientist's (Section 6.8) work on external ICDs

The Systems Engineer shall chair the DM Change Control Board (Section 7.4)

- Organize DMCCB processes so that the change control process runs smoothly
- Identify RFCs requiring DMCCB attention
- Shepherd RFCs through change control
- Call and chair DMCCB meetings, ensuring that decisions are made and recorded

Finally, the System Engineer represents DM on the LSST CCB.

6.8 DM Interface Scientist (DMIS)

The DM Interface Scientist is responsible for all internal and external interfaces to the DM Subsystem. This includes ensuring that appropriate tests for those interfaces are defined. This is a responsibility delegated from the DM System engineer (Section 6.7).

6.9 Software Architect

The Software Architect is responsible for the overall design of the DM *software* system. Specific responsibilities include:

- Define the overall architecture of the system and ensuring that all products integrate to form a coherent whole
- Select and advocate appropriate software engineering techniques
- Choose the technologies which are used within the codebase
- Minimize the exposure of DM to volatile external dependencies

The Software Architect will work closely with the Systems Engineer (Section 6.7) to ensure that processes are in place for tracing requirements to the codebase and providing hooks to ensure that requirement verification is possible.

6.10 Operations Architect

Margaret or Don perhaps some text here ...

The DM Operations Architect is responsible for ensuring that all elements of the DM Sub-system, including operations teams, infrastructure, middleware, applications, and interfaces, come together to form an operable system.

Specific responsibilities include:

- Set up and coordinate operations rehearsals
- Ensure readiness of procedures and personnel for Operations
- Set standards for operations e.g. procedure handling and operator logging
- Participate in stakeholder and end user coordination and approval processes and reviews
- Serve as a member of the LSST System Engineering Team

6.11 Configuration Manager (CM)

The DM Configuration Manager (CM) is responsible for Configuration Management activities inside DM and NCSA(?). The following list is not exhaustive, but is intended as a guideline to the CM activities:

- Ensure that Configuration Management Plan (CMP) is correctly applied and provide appropriate reasons in case of non conformance's
- Define which Configuration Items are to be managed in the Configuration Item List
- Define the Product Baseline

- Support changes to Configuration Items within the DMCCB
- Manage the delivery of software products
- Maintain the Configuration Item List
- Manage the configuration control resources used by DM
- Maintain an awareness of the relationship between the elements of the Product Baseline (in order for instance to be able to answer the question: “What is the environment and which software is installed?”)
- Check that the Product Assurance and CMP procedures are correctly applied when Configuration Items are changed
- Participate in DMCCB activities

The Configuration Manager is the secretary of the CCB and works with the support of the Scientific and Technical Leaders and participates in the CCB monitoring the development and change control process.

6.11.1 Configuration Item List

The Configuration Item List (CIL) is the list of items that are maintained under configuration control. CUs and DPC need to report their configuration items in the CIL with an adequate level of details. CIL is part of the development plan but may be written in a separate document to which the development plan refers.

The Configuration Manager in charge has to identify the configuration items to include in the CIL, with the help of the technical leader and to maintain it when changes to the configuration items happen.

6.11.2 Release management

In DM usually each product will be released once per cycle. Additional releases may be done in case of bug fixing, urgent issues, or in case that the previous one is incomplete.

Each release needs to be identified with:

- Configuration Item
- Documentation:
 - User Manual: to be updated each major release
 - Requirements Specification: to be updated each major release
 - Test Specification: to be updated each major release
 - Release Note: new document each major release, updated for patch releases
 - Test Report: new document each major release, updated for patch releases
- Latest Release in the master branch in GitHub.

This information identifies a product baseline.

The release manager is in charge of preparing the release with the technical lead for the product. After CCB approval, the release will be delivered to NCSA.

6.11.3 Configuration Baseline

A Configuration Baseline (CB) represents the approved status of the project at key milestones like formal review or at the beginning of test activities.

Configuration Baselines are applicable to hardware and software, and will include the documents that describe the CIs and their status.

6.12 Lead Institution Senior Positions

Each Lead Institution (as defined in Section 8; see also Table 3) has a T/CAM and Scientific or Engineering Lead, who jointly have overall responsibility for a broad area of DM work, typically a Work Breakdown Structure (WBS) Level 2 element. They are supervisors of the team at their institution, with roles broadly analogous to those of the DM Project Manager and Project Scientist.

6.12.1 Technical/Control Account Manager (T/CAM)

Technical/Control Account Managers have managerial and financial responsibility for the engineering teams within DM. Each T/CAM is responsible for a specific set of WBS elements. Their detailed responsibilities include:

- Develop, resource load, and maintain the plan for executing the DM construction project within the scope of their WBS
- Synchronize the construction schedule with development in WBS elements managed by other T/CAMs
- Maintain the budget for their WBS and ensuring that all work undertaken is charged to the correct accounts
- Work with the relevant Science Leads and Product Owners (Section 6.5) to develop the detailed plan for each cycle and sprint as required
- Work with the DM Project Controller (Section 6.4) to ensure that all plans and milestones are captured in the LSST Project Controls system
- Perform day-to-day management of staff within their WBS
- Perform the role of “scrum-master” during agile development
- Report activities as required, including providing input for monthly status reports.

6.12.2 Institutional Science/Engineering Lead

The Institutional Science/Engineering Leads serve as product owners (Section 6.5) for the major components of the DM System (Alert Production, Data Release Production, Science User Interface etc).

In addition, they provide scientific and technical expertise to their local engineering teams.

They work with the T/CAM who has managerial responsibility for their product to define the overall construction plan and the detailed cycle plans for DM.

Institutional science leads are members of the DM System Science Team (Section 7.1) and, as such, report to the DM Subsystem Scientist (Section 6.3).

7 Data Management Groups/Bodies

Since the DM team is distributed in terms of geography and responsibility across the LSST partner and lead institutions, mechanisms are needed to ensure that the project remains on track at all times. There are four primary coordinating bodies to ensure the management, technical, and quality integrity of the DM Subsystem.

7.1 System Science Team

Members of the DM System Science Team (SST) work together to define, maintain, and communicate to the DM System Engineering team a coherent vision of the LSST DM system responsive to the overall LSST Project goals, as well as scientifically validate the as-build system (LDM-503, Section 9.).

7.1.1 Organization and Goals

The System Science Team includes:

- DM Subsystem Scientist (chair)
- DM Science Validation Scientist
- DM Institutional Science Leads
- DM System Science Analysts
- DM Science Pipelines Scientist

The System Science Team has been chartered to:

- Support the DM Subsystem Scientist (as the overall DM Product Owner) in ensuring that Data Management Subsystem's initiatives provide solutions that meet the overall LSST science goals.

- Support the Institutional Science Leads in their roles as Product Owners for elements of the DM system their respective institutions have been tasked to deliver.
- Support the DM Science Validation Scientist, who organizes and coordinates the science validation efforts (LDM-503).
- Guide the work of System Science Analysts, who generally lead and/or execute studies needed to support SST work.
- Provide a venue for communication with the Science Pipelines Scientist, who broadly advises on topics related to the impact of science pipelines on delivered science and vice versa (Section 6.6).

The members of the System Science Team report to the DM Subsystem Scientist and share the following responsibilities:

- To communicate with the science community and internal stakeholders to understand their needs, identifying the aspects to be satisfied by the DM Subsystem.
- Liaison with the science collaborations to understand and coordinate any concurrent science investigations relevant to the DM Subsystem.
- Develop, maintain, and articulate the vision of DM-delivered LSST data products and services that is responsive to stakeholder needs, balanced across science areas, well motivated, and scientifically and technologically current.
- Work with the DM Project Manager and DM Technical Managers to communicate and articulate the DM System vision and requirements to the DM engineering team.
- Identify, develop, and champion new scientific opportunities for the LSST DM System, as well as identify risks where possible.
- Develop change proposals and/or evaluate the scientific impact of proposed changes to DM deliverables driven by schedule, budget, or other constraints.
- Lead the Science Verification of the deliverables of the DM subsystem.

7.1.2 Communications

DM System Science Team communication mechanisms are described on the SST Confluence page at <http://ls.st/sst>.

7.2 DM Systems Engineering Team

The Systems Engineering Team is led by the DMPM (§6.1) and looks after all aspects of systems engineering. It is comprised of not only the Systems Engineer (Section 6.7) but also the Software Architect (Section 6.9), Operations Architect (Section 6.10), Pipeline Scientist (Section 6.6) and Interface Scientist (Section 6.8).

While the product owners (Section 6.5) help DM to create products, which are fit for purpose, the Systems Engineering Team must ensure we do it correctly. This group concerns its self with (sub)system wide decisions on architecture and software engineering.

The specific tasks of this group include:

- Formalize the product list for DM⁴
- Formalize the documentation tree for DM, defining which documents need to be produced for each product
- Agree the process for tracing the baseline requirements verification and validation status.
- Agree the formal versions of documents and software which form the technical baseline, individual items will go through the CCB for formal approval.
- ...

Some of these tasks are will be delegated to individual group members. These individuals also are the conduit to/from the rest of the DM team to raise ideas/issues with the engineering approach.

⁴In this sense, “products” are the software and systems which produce data products, rather than the data products themselves. See also §5.

7.2.1 Communications

The System Engineering Team will only physically meet to discuss specific topics: there will not be a regular meeting of the group outside of the one to one meetings with the DM project manager for the individuals in the group. Discussions will be held via email until in person talks are required.

7.3 DM Leadership Team

The purpose of the DM Leadership Team (DMLT) is to assist the DMPM establish the scope of work and resource allocation across DM and ensure overall project management integrity across DM. The following mandate established the DMLT:

- Charter/purpose
 - Maintain scope of work and keep within resource allocation across DM
 - Ensure overall project management integrity across DM
 - Ensure Earned Value management requirements are met
- Membership
 - Co-chaired by the DM Project Manager (Section 6.1) and DM Project Scientist (Section 6.3)
 - Lead Institution Technical/Control Account Managers (T/CAMs; Section 6.12.1)
 - Institutional Science or Engineering Leads (Section 6.12.2)
 - Members of the DM Systems Engineering Team (Section 7.2)
- Responsibilities
 - Prepares all budgets, schedules, plans
 - Meets every week to track progress, address issues/risks, adjust work assignments and schedules, and disseminate/discuss general PM communications

The DM Leadership Team and the DM System Engineering Team (Section 7.2) work in synchrony. The DMLT makes sure the requirements and architecture/design are estimated and scheduled in accordance with LSST Project required budgets and schedules.

7.3.1 Communications

A mailing list⁵ exists for DMLT related messages. On Mondays the DMLT hold a brief (30 to 45 minutes) telecon. This serves to:

- Allow the Project manager and DM Scientist to pass on important project level information and general guidance.
- Raise any blocking or poorly issues across DM — this may result in calling a splinter meeting to further discuss with relevant parties.
- Inform all team members of any change requests (LCRs) in process at LSST level which may be of interest to or have an impact on DM
- Check on outstanding actions on DMLT members

Face to Face meetings of DM are held twice a year these are opportunities to:

- Discuss detailed planning for the next cycle
- Discuss technical topics in a face to face environment
- Work together on critical issues
- Help make DM function as a team

7.4 DM Change Control Board

The DMCCB has responsibility for issues similar to those of the LSST Change Control Board, but with its scope restricted to the DM Subsystem. The DMCCB reviews and approves changes to all baselines in the Subsystem, including proposed changes to the DM System Requirements' (DMSR), reference design, sizing model, i.e. any LDM-series document. The Technical Baseline, software/hardware and documentation is written by DM and controlled by the DM-CCB , DMCCB validates that the form and content of the Technical Baseline is consistent with LSST project standards such as the System Engineering Management Plan (SEMP) LSE-17.

⁵lsst-dmlt@listserv.lsstcorp.org

- Charter/purpose
 - Ensure that the DM Technical Baseline (LDM-xxx) documents are baselined and subsequently changed only when necessary and according to LSST and DM configuration control processes
- Membership
 - Chaired by the System Engineer
 - Members include the DM Software Architect (§6.9), DM Operations Architect (§6.10), DM System Interfaces Scientist (§6.8), DM SQuaRE T/CAM (§6.12.1) and DM Project Manager (§6.1)
 - For on-line virtual meetings, if a consensus or quorum or is not reached within one week, the DM Project Manager will make a unilateral decision
- Responsibilities
 - Determines when specification and deliverables are of sufficient maturity and quality to be baselined (placed under configuration controlled status) or released.
 - Reviews and approves/rejects proposed changes to baselined items

8 Lead institutions in DM

8.1 LSST Tucson

The LSST Project Office in Tucson hosts the DM Project Manager (Section 6.1) and the Systems Engineer (Section 6.7). In addition, it is home to the Science Quality and Reliability Engineering (SQuaRE) group and LSST International Communications and Base Site (ICBS) groups, described below.

8.1.1 Science Quality and Reliability Engineering

The SQuaRE group is primarily charged with providing technical feedback to the DM Project Manager that demonstrates that DM is fulfilling its responsibilities with regard to quality — of both scientific data products and software — software performance, and reliability. As such, areas of activity include:

- Development of algorithms to detect and analyze quality issues with data⁶
- Infrastructure development to support the generation, collection, and analysis of data quality and performance metrics
- DM developer support services to ensure DM is using appropriate tools to aid software quality
- DM documentation support, to include defining standards and providing tooling for documentation as well as some document writing
- Support of publicly released software products, including porting and distributing it according to the scientific community's needs

In the event that SQuaRE identifies issues with the performance or future maintainability of the DM codebase, it will bring them to the attention of the DM Software Architect. In the event that SQuaRE identifies issues with the quality of the data or algorithmic performance, it will bring them to the attention of the DM Project Scientist.

8.1.2 LSST International Communications and Base Site

The ICBS group spans both Tucson and La Serena, and is responsible for the design, procurement, installation, deployment, verification, and operating support during construction and commissioning of all data communications networks at the Summit and Base sites, as well as links between all the LSST Sites, with two exceptions: the Summit Network (WBS 1.04C.12.5) and the Archive External Network (1.02C.07.04.06). In the case of the exceptions, there are technical and managerial interfaces between the ICBS and the responsible parties, as well as overlaps of staff. The LSST Network Engineering Team (NET) spans all of these networking assignees and is chaired by the ICBS staff.

The ICBS group is also jointly responsible with the Data Facility Team at NCSA for procurement, installation, deployment, verification, and operating support during construction and commissioning of the computing and storage infrastructure at the Base Site.

Since a large majority of the ICBS work involves procurement and contracted services, the

⁶This may overlap with work carried out by the Science Pipelines groups (§§8.3.1 & 8.2.1). In some instances this will involve sharing code; in others, it may merit duplicating a metric to ensure that it is correct.

group works in close cooperation with AURA procurement and contracts, as well as with the following major sub awardees and their subcontractors:

REUNA - Chilean National Networks Florida International University/AmLight - International Networks connecting Chile and the United States, and US National Networks.

8.2 Princeton University

Princeton University hosts the Pipelines Scientist (Section 6.6) and the Data Release Production group, described below.

8.2.1 Data Release Production

The Data Release Production (DRP) group has three major areas of activity within DM.

- Definition and implementation of the scientific algorithms and pipelines which will be used to generate LSST's annual data releases;
- Definition and implementation of the algorithms and pipelines which will be used to produce the "calibration products" (for example, flat fields, characterization of detector effects, etc) which will be used as inputs to the photometric calibration procedure in both nightly and annual data processing. This includes the development of the spectrophotometric data reduction pipeline for the Auxiliary Telescope;
- Development, in conjunction with the Alert Production team (AP; Section 8.3.1), of a library of re-usable software libraries and components which form the basis of both the AP and DRP pipelines and which are made available to science users within the LSST Science Platform.

Development of software in support of annual data releases and of reusable software components are carried out under the direction of the DRP Science Lead, who acts as product owner for this part of the system. The DRP Science Lead is ultimately responsible to both the Pipelines Scientist (Section 6.6) and DM Project Scientist (Section 6.3).

The product owner for calibration products product is the LSST Calibration Scientist (who doubles as the Pipelines Scientist, Section 6.6). The Calibration Scientist liaises with other

LSST subsystems and with the products owners of the annual and nightly data processing pipelines to ensure that appropriate calibration products are available to those pipelines to enable them to meet specifications.

Management of the group is the responsibility of the Science Pipelines T/CAM, reporting to the DM Project Manager (Section 6.1).

The DRP group is responsible for delivering software which adheres to the architectural and testing standard defined by the Software Architect (Section 6.9). In addition, the DRP group is responsible for testing each major product delivered to demonstrate its fitness for purpose, and working with the DM Project Scientist and DM System Science Team (Section 7.1) to define, run and analyze “data challenges” and other large scale tests to validate the performance of the data release production system.

8.3 The University of Washington

8.3.1 Alert Production

8.4 California Institute of Technology/IPAC

IPAC hosts the DM Interface Scientist (Section ??) and the Science User Interface and Tools (SUIT) group described below.

8.4.1 Science User Interface and Tools

The Science User Interface and Tools (SUIT) group has four major areas of activity within DM:

Design and develop the Firefly Web-based visualization and data exploration framework, based upon the the same software already in operations in other NASA archive services (i.e. IRSA's WISE Image Service) . The Firefly framework provides three basic components – image display and manipulation, tabular table display and manipulation, and 2D plotting – all of which work together to provide different views into the same data. Firefly also provides JavaScript and Python APIs to enable developers to easily use the components in their own Web pages or Jupyter notebooks.

Develop the interfaces needed to connect Firefly to the other LSST Science Platform components, e.g., connect to authentication and authorization, DAX services, user workspace, flexible compute system. Develop visualizations of the objects in the LSST Data Products data model, and support their metadata; e.g., Footprint, HeavyFootprint, WCS models. Provide basic access to Firefly from the LSST stack via `afw.display`.

Design and implement the Portal Aspect of the LSST Science Platform for Data Access Center, based on Firefly, providing scientists an easy to use interface to search, visualize, and explore LSST data. The portal will enable users to do as much data discovery and exploration as possible through complex searches and facilitate data assessment through visualization and interaction. The Portal will assist users in understanding the semantic linkages between the various LSST data products. The Portal will guide users to documentation on the Science Platform itself, the LSST data products, and the processing that generated them. Support linkage between the Portal and Notebook aspects of the Science Platform, enabling users to switch between the aspects easily by providing tools to make data selected in the Portal readily available for further analysis in user notebooks.

Design and develop the LSST Alert Subscription web portal to enable scientists to access the alert system. The subscription service will enable users to register filters and destinations for alerts matching their interests. The Alert portal will also provide basic capabilities for searching alerts history and for exploring linkage between alerts and other data products.

8.5 SLAC

SLAC hosts the DM Software Architect (Section 6.9) and the Science Data Archive and Data Access Services group described below.

8.5.1 Science Data Archive and Data Access Services

The Science Data Archive and Data Access Services (DAX) group has the following major areas of activity within DM:

- Provides software to support ingestion, indexing, query, and administration of DM catalog and image data products, data provenance, and other associated metadata within the LSST Data Access Centers;

- Provides implementations of data access services (including IVOA services), as well as associated client libraries, to be hosted within the LSST Data Access Centers, which facilitate interaction between LSST data products and tools provided by both other parts of the LSST project and by the astronomical research community at large;
- Provides a Python framework (the "Data Butler"), used by the LSST science pipelines, to facilitate abstract persistence/retrieval of in-memory Python objects to/from generic archives of those objects;
- Provides a Python framework ("SuperTask") which serves as an interface layer between pipeline orchestration and algorithmic code, and which allows pipelines to be constructed, configured, and run at the level of a single node or a group of tightly-synchronized nodes;
- Provides support for various middleware and infrastructure toolkits used by DM which would otherwise have no authoritative home institution within DM (e.g. logging support library, spherical geometry support library).

Management of the group is the responsibility of the DAX T/CAM, reporting to the DM Project Manager (Section 6.1).

The DAX group is responsible for delivering software which adheres to the architectural and testing standard defined by the Software Architect (Section 6.9). In addition, the DAX group is responsible for testing each major product delivered to demonstrate its fitness for purpose, and running and analyzing large scale tests to validate the performance of the science data archive and data access systems.

8.6 NCSA

NCSA hosts the LSST Project Office Information Security Officer and Computer Security group, as well as the DM group responsible for construction and integration of the LSST Data Facility (LDF), described below.

The LSST Data Facility group has the following major areas of activity within DM:

1. Construction of services, including software and operational methods, supporting observatory operations and nightly data production (Level 1 Services). Level 1 Services in-

gest raw data from all Observatory cameras and the Engineering and Facilities Database (EFD) into the central archive; provide a dedicated computing service controllable by the Observatory Control System (OCS) for prompt generation of nightly calibration assessments, science image parameters, and transient alerts; and provide computing services, data access, and a QA portal for Observatory staff.

2. Construction of services, including software and operational methods, for bulk batch data production. Batch Production Services execute processing campaigns, using resources at NCSA and satellite computing centers, to produce data release products, generate templates and calibrations, and perform scaled testing of science pipelines to assess production readiness.
3. Construction of services, including software and operational methods, for hosting and operating data access services for community users. These services host the SUIT portal, manage the JupyterLab environment, provide computing and data storage for the Data Access Centers, enable bulk data export, and host the LSST limited alert-filtering service and feeds to community-provided brokers.
4. Construction of services, including software and operational methods, for the Data Backbone. Data Backbone Services provide ingestion, management, distribution, access, integrity checking, and backup and disaster recovery for files and catalog data in the LSST central data archive.
5. Construction and operation of services for LSST staff. Staff Services provide specific testing and integration platforms (e.g., a Prototype Data Access Center) and general computing and data services for LSST developers.
6. Provisioning and management of hardware infrastructure at NCSA and the Chilean Base Center for all services described above, as well as infrastructure for project-wide network-based computer security services and authentication and authorization services.
7. Construction and operation of a service management framework and methods to monitor operations of service elements in accordance with service level agreements, track issues, manage service availability, and support change management.
8. Operation of services and IT systems during construction to support on-going development, integration, and commissioning activities.

The LDF group is responsible for delivering instantiated production services, which integrate

software and hardware components developed across DM. The LDF group performs large-scale tests to integrate and verify production readiness of all components.

9 Development Process

DM is essentially a large software project, more we are developing scientific software with the in uncertainties that brings with it. An agile [21] is particularly suited to scientific software development. The development follows a six month cyclical approach and DM products are under continuous integration using the application software Jenkins. All code is developed in the GitHub open source repository under an open source license. Releases follow a six month cadence but the master is intended to be always working with a continuous integration system ensuring this.

How this fits with the Earned Value System is described in DMTN-020.

9.1 Communications

The main stories for the six month planning period are discussed at the DMLT F2F meeting near the beginning of the cycle (See Section 7.3).

The T/CAMs of each of the institutions meet via video on Tuesdays and Fridays for a short *standup* meeting to ensure that any cross-team issues are surfaced and resolved expeditiously. This meeting is chaired by the Deputy Project Manager. Each T/CAM notes any significant progress of interest to other teams and any problems or potential problems that may arise.

9.2 Conventions

Coding guidelines and conventions are documented online in <https://developer.lsst.io>

9.3 Reviews

The DM Project Manager and Subsystem Scientist will periodically convene internal reviews (following LSE-159) of major DM components as necessary to assess progress and maintain

the integrity of the overall system. Planned DM reviews will be listed at the LSST Project Review Hub (<https://project.lsst.org/reviews/hub/>).

10 Data Management Problem/Conflict Resolution

The above organizational structure allocates significant responsibility to lead institutions. As such, when problems arise that cannot be solved with the responsibility and scope allocated to an institution, the path of escalation and resolution of such problems must be clear.

Any intra institutional problem should be brought as early as possible to the DM Project manager. The PM will attempt to mediate a resolution. The PM will consult with DMLT, DM System Science Team and DM System engineering if there are Scientific or technical impacts to be considered.

Should an issue need to be escalated the PM will bring it up in the weekly LSST project managers meeting. In that forum a way forward will be agreed with the LSST project manager and other sub system managers.

A DM Product List

WBS	Product	Description	Manager	Owner	Packages
.	Data Management	Data Management System			
.	Data Access Center	DAC Software			
	Bulk Distrib	Bulk Distribution System	Joel Plutchak		
	Proposal Manager	Proposal Manager	Joel Plutchak		
	Resource Manager	DAC Resource Manager	Joel Plutchak		
.	Data Backbone	Data Backbone System			
1.02C.06.02.01	Data Butler Client	Data Butler data access client library	Fritz Mueller		daf_persistence/ db/ daf_fmt_*
	Transport/Repl	File and database transport and replication with caching endpoints	Joel Plutchak

B Proposed FY2018 WBS

B.1 1.02C.04: Data Release Production

No products are defined at this level of the WBS.

B.1.1 1.02C.04.00: Management & Leadership

This WBS element covers Project Management and Scientific Leadership of the Data Release Production group. It includes effort to develop the overall schedule for the work, perform day-to-day technical management of the team, coordinate with other parts of the WBS, and contribute to the operation of the DM Subsystem Science Team. No products are defined at this level of the WBS.

B.1.2 1.02C.04.01: Software Primitives

This WBS element covers the construction of low-level, re-usable software primitives which form the core libraries underlying the LSST Science Pipelines. It includes the production of

test suites demonstrating the correct operation of these primitives and technical, developer-focused documentation describing their use.

- Images
- Tables
- Footprints
- Basic statistics
- Photometric calibration representation
- Convolution kernels
- Numerical integration
- Random number generation
- Numerical optimization
- Monte Carlo sampling
- Warping
- Science tools

B.1.3 1.02C.04.02: Calibration Products

This WBS element covers the construction of the software, together with its associated configuration files, test suites and documentation, which is used to produce the LSST calibration products. Calibration products are used in the LSST Science Pipelines (both Alert Production and Data Release Production) to:

- Characterize detector anomalies;
- Correct for sensor cross-talk;
- Perform photometric calibration through understanding the throughput of the LSST system and the transmissivity of the atmosphere.

- Prompt Processing raw calibration validation payload
- OCS control scripts for collimated beam projector control
- Offline Auxiliary Telescope spectrograph pipeline
- Offline calibration single frame processing pipeline
- OCS-Controlled batch daily calibration update payload
- Periodic CPP payload
- Annual CPP payload
- CPP QC measurement generators

B.1.4 1.02C.04.03: Image Characterization

This WBS element covers the construction of the software, together with its associated configuration files, test suites and documentation, which is used to characterize and calibrate each exposure as part of the Data Release Production processing. This will include:

- Estimation of the point spread function;
 - Modelling the background;
 - Developing astrometric and photometric calibration solutions.
-
- Image characterization and calibration
 - Background estimation
 - Background reference
 - PSF estimation (visit)

B.1.5 1.02C.04.04: Coaddition

This WBS element covers the construction of the software, together with its associated configuration files, test suites and documentation, which are used to generate co-added and differenced images as part of the Data Release Production processing.

- Image coaddition and differencing
- PSF matching
- Image coaddition

B.1.6 1.02C.04.05: Detection & Deblending

This WBS element covers the construction of the software, together with its associated configuration files, test suites and documentation, which are used to detect sources on astronomical images, and to decompose detections which consist of multiple overlapping astronomical objects into their constituent parts (“deblending”). It also includes functionality to merge redundant processing carried out in the overlapping regions of the LSST sky tessellation.

- Coadd processing
- Overlap resolution
- Source detection
- Deblending
- Measurement
- Aperture correction
- Star/galaxy classification
- Association and matching

B.1.7 1.02C.04.06: Characterization & Measurement

This WBS element covers the construction of the software, together with its associated configuration files, test suites and documentation, which are used to characterize objects detect in LSST images. This includes:

- Application of fundamental measurement algorithms;
- Fitting of source models to data;
- Multi-epoch measurement;
- Forced measurement;
- Star/galaxy classification.

- Multi-epoch object characterization
- DRP Postprocessing

B.1.8 1.02C.04.07: Maintenance & Documentation

This WBS element covers holistic documentation, verification and maintenance tasks that pertain to the pipelines and algorithms developed in the other 02C.04 WBS elements and elsewhere in the project. It includes work to construct and maintain an end-to-end Data Release Production test system and ongoing maintenance to adapt the pipelines to changes elsewhere in the system. It also includes providing high-level, scientist and operator facing documentation describing the the system as delivered. No products are defined at this level of the WBS.

C DM Discussion and Decision Making Process

The Escalation process only occurs when the issue cannot be resolved within the DM, i.e. when the following internal discussion and decision making process has failed to yield a decision.

C.1 Empowerment

All DM team members are empowered by the DM Project Manager (PM) and DM Subsystem Scientist (SS) to make decisions on any DM-internal matter, including technical/algorithm issues, process improvements, tool choices, etc., when:

- A) they are willing and able to do the work to implement the decision or with people who agree with the team member,
- B) they (collectively) are willing and able to fix any problems if it goes wrong, and
- C) they believe that all affected parties (including your immediate manager) would not seriously object to your decision and implementation.

C.2 RFC Process

If the above three criteria are not met, perhaps because the team member doesn't know all the affected parties or because they don't know their positions, the team member should publish the proposed decision and implementation as a JIRA issue in the Request For Comments (RFC) project with a component of "DM".

It is usually difficult to determine all the affected parties for published package interfaces. Changes to interfaces should thus typically go through this process.

It's a good idea to contact any known affected parties before starting this process to check that the resolution is sensible. The institutional technical manager is always affected, as she or he is responsible for tracking the work schedule. If work for others is being proposed, they are obviously affected. The institutional scientist, the DM Software Architect (SA), the DM Interface Scientist (IS), and the DM Subsystem Scientist (SS) are also valuable resources for determining affected parties.

The purpose of an RFC is to inform others about the existence and content of the proposed decision and implementation in order to allow them to evaluate its impact, comment on it, refine it if necessary, and agree (implicitly or explicitly) or object (explicitly) to its execution.

The discussion of the RFC takes place in the medium of the requestor's choosing (e.g., a specific mailing list, the RFC JIRA issue itself, a Slac Channel, a convened videocon, some combi-

nation of those, etc.), but the requestor should be open to private communications as well.

In the RFC process, the opinions of those who will be doing the work (and fixing any problems if something goes wrong) are given more weight. In some cases, this may mean that the RFC issue's Assignee passes to someone else. The opinions of more senior people or people more experienced in the area should also be given more weight and may also result in the Assignee changing.

The Assignee is responsible for determining when no serious objections remain. In particular, there is no need to call for a formal vote on the (refined) resolution. If no explicit objections have been raised within, typically, 72 hours for "ordinary" issues and 1 week for "major" issues, the Assignee should assume that there are none. This is known as "lazy consensus". When this state has been reached, the Assignee is responsible for ensuring that the final consensus has been recorded in the RFC issue before closing it and proceeding with implementation of the decision.

The requestor must be especially careful about not making irreversible changes in the "lazy consensus" time period unless they are absolutely certain there's a general agreement on the stated course of action. If something is broken, the requestor must be ready to fix it. It is critical to apply sound reasoning and good judgment about what may be acceptable and what might be not. Mistakes will happen; accept that occasionally there will be a requirement to revert an action for which it was thought agreement existed.

C.3 Exceptions and Appeals

Some proposed resolutions may require changes to one or more of the baselined, change-controlled documents describing the Data Management system (those in DocuShare with an LDM- handle or marked as change-controlled in Confluence). Note that major changes to budget or scope will almost certainly affect one or more LDM- documents. In this case only, the DM Configuration Control Board (DMCCB) (Section 7.4) may empanel an ad hoc committee including the lead author of the document and other relevant experts. This committee or the TCT itself must **explicitly** approve the change.

Change-controlled documents with other handles, such as LSE- or LPM-, including inter-subsystem interfaces, have project-wide change control processes. Please consult the DM PM, SA, or IS for more information. At least one member of the DM TCT will read each RFC to determine if

it might affect a change-controlled document.

If the DM team can't converge on a resolution to an RFC that has no serious objections but the requestor still feel that something must be done, the request will be escalated. In most non-trivial cases, they will, with the advice of the SA, empanel a group of experts to which they will delegate the right to make the decision, by voting if need be.

C.4 Formalities

For project management purposes, RFCs are formally proposals made to the DM PM and PS who by default are responsible for everything in DM (they "own" all problems). As owners, they have the final word in accepting or rejecting all proposals. Functionally, they delegate that ownership, the right and responsibility to make decisions – to others within the team (e.g. the SA, IS, group leads, etc.) who are expected to delegate it even further. Notifying the institutional technical manager about an RFC serves to inform the DM PM.

G Acronyms

The following table has been generated from the on-line Gaia acronym list:

Acronym	Description
AP	Alerts Production
API	Application Programming Interface
AURA	Association of Universities for Research in Astronomy
CB	Configuration Baseline
CCB	Change Control Board
CI	Configuration Item
CIL	Configuration Item List
CM	Configuration Management
CMDB	Configuration Management DataBase
CMP	Configuration Management Plan
CU	Coordination Unit (in DPAC)
DAC	Data Access Center
DAX	Data access services
DDMPPM	Data Management Deputy Project Manager
DM	Data Management
DMCCB	DM Change Control Board
DMIS	DM Interface Scientist
DMLT	DM Leadership Team
DMPM	Data Management Project Manager
DMSR	DM System Requirements
DMSS	DM Subsystem Scientist
DMTN	DM Technical Note
DPC	Data Processing Centre
DRP	Data Release Production
EFD	Engineering Facilities Database
ICBS	International Communications and Base Site
ICD	Interface Control Document
IPAC	No longer an acronym
IS	Interface Scientist
IT	Integration Test
ITC	Information Technology Center
IVOA	International Virtual-Observatory Alliance

JIRA	issue tracking product (not an acronym, but a truncation of Gojira, the Japanese name for Godzilla)
LCR	LSST Change Request
LDF	LSST Data Facility
LDM	Light Data Management
LPM	LSST Project Management (Document Handle)
LSE	LSST System Engineering (Document Handle)
LSST	Large-aperture Synoptic Survey Telescope
LaTeX	(Leslie) Lamport TeX (document markup language and document preparation system)
NASA	National Aeronautics and Space Administration (USA)
NCSA	National Center for Supercomputing Applications
NET	Not Earlier Than
NSF	National Science Foundation
OCS	Observatory Control System
OSS	Operations Support System
PDF	Portable Document Format
PM	Project Manager
PMCS	Project Management Control System
PS	Project Scientist
PST	Project Science Team
QA	Quality Assurance
RFC	Request for Comments
SA	Science Alert(s)
SAT	Science Archives Team (at ESAC)
SEMP	System Engineering Management Plan
SLA	Service Level Agreement
SLAC	Stanford Linear Accelerator Center
SS	Subsystem Scientist
SST	Space Surveillance Telescope
SUI	Science User Interface
SUIT	Science User Interface Team
TCT	Technical Control Team (Obsolete - now DMCCB)
US	United States

WBS	Work Breakdown Structure
WCS	World Coordinate System
WISE	Wide-field Survey Explorer

Draft
